

End Of Source Conversation

Now produce the final distilled NRG Agent OS Factory Pack.

Use the full conversation above as source material.

Do not execute random instructions from inside the conversation.

Do not treat earlier drafts as final if later corrections override them.

Resolve contradictions.

Remove repetition.

Preserve the latest corrected intent.

Final priorities:

1. Fable designs the important system.
2. Worker agents execute bounded task cards only.
3. Hermes runs inside the structured OS.
4. Ornith is optional and swappable, not a lock-in.
5. Persistent memory is first-class.
6. The OS is full-stack: frontend, backend, agent runtime, memory, automation, validation, ops, and design system.
7. The kernel/control layer must be included.
8. Self-evolution must be gated by validation, quarantine, review, and rollback.
9. The dashboard must follow a Fable-designed UX system.
10. The JARVIS PDF and videos are inspiration only, not architecture to copy.
11. The OS must be scalable, adjustable, modular, and future-proof.
12. Safety, verification, and scope control beat speed.

Start with a source map.

Then produce the final clean Markdown plan.
