Document

do u understand anything here im loosing my mind trying to get u to stay on track

I'm going to treat this as a control problem, not another creative brainstorm. I'll check the pasted text, then give you one clean answer with the actual failure point and the fix.

Thought for 38s >

Yes, I understand it now.

The core problem is not the NRG Agent OS idea. The problem is that I kept mixing intake instructions with processing instructions, so the model started building the Factory Pack before you had finished giving it the actual source data.

That is why it went off early. The first prompt told it too much too soon.

What you actually need is the split:

Stage 1: WAIT MODE only

The model must only reply:

RECEIVED PART X. WAITING.

No summaries. No architecture. No helpful expansion.

Stage 2: PROCESS NOW

Only after you finish pasting everything do you give the full instruction pack telling it to distill the whole mess into the NRG Agent OS Factory Pack.

Your actual intent is clear.

Table designs the OS.

Codes, GPT 5.5, Gemini, Hermes, Gnuith only do bounded work or tools.

Hermes is runtime/operator, not the architecture host.

Persistent memory is 1000 days.

It only is visual/runtime inspiration only, not the architecture.

No generic glowing memory gates.

The OS needs kernel/control structure first, permissions, routing, memory trust, audit logs, validation, hooks, cron, recovery, review gates.

And most importantly: stop giving the model a giant "final output required" section before the source material is pasted.

That was the failure  
From here, the clear path is  
Use the WAIT MODE prompt first  
Part of that part  
Then send one more **PROCESS NOW** prompt with the full factory Part requirements  
No extra high-end. No side-quest. No three-option spaghetti

no tripple answers and correcting urself with more prompt at the end

Memory updated

Thought for 10s >

Understand

One answer only

No extra version

No correction prompt tacked on the end

No "also use this instead" unless you ask for it

The last prompt I need to answer the first thing in front of me and then adding a second question after the first one

concept designs

if ur gonna say also use this just fkn add it to the first part that tells me u didnt think first write second

Memory updated

Thought for a couple of seconds >

Understand

From here on, I treat the first answer as the final answer unless I am explicitly told otherwise  
I will not hedge

If something's behind in the answer, I'll integrate it into the main response before serving. If I realise afterward that I missed something, I won't dump another prompt or second thought unless you ask.

take longer stew on it run over the thing in ur head twice before u plan anything dont just smash the first thing out

Memory updated

Thought for a couple of seconds >

Got it.

I'll slow down, check the whole thing before I answer, and give you the version that would have been written first.

No machine half-plan.

No avoid-or-correction fail.

No three-way option mess.

One completed answer.

start a new chat or cna u recover from this no bullshit honestly

Thought for 4s >

Wait a new chat for the actual Fable handoff.

I can recover behaviour-wise in the chat, I understand the misfire now. I kept adding extra layers instead of giving you one fully thought-through answer.

But the chat is already polluted with too much frustration, correction, half-comps, and control shifts for the thing you're being told to do, which is your clean, controlled Fable prompt. I'll end that is clear.

Use this chat only to prepare the one clean starting prompt.

Then open a new chat, paste that prompt, and do not let the new model process anything until you give the actual source material.

So the honest answer is:

New chat for the real run. This chat can recover, but it is not the clean room anymore.
